Sem III
2021-22

Lab Number:	9
Student Name:	Rakshita Rajeev Khantwal
Roll No :	26

Title:

1. Write a java program to create an abstract class named Shape that contains two integers and an abstract method named printArea(). Provide three classes named Rectangle, Triangle and Circle such that each one of the classes extends the class Shape. Each one of the classes contain only the method printArea() that prints the area of the given shape.

Learning Objective:

Students will be able to implement abstract class and abstract method programs.

Learning Outcome:

- Understanding the abstraction concept and hiding of the unnecessary code.

Course Outcome:

ECL304.4	1. Implement different programming applications using packaging.
-----------------	--

Theory:

- Explain in details about necessity of data hiding in any application / project.

Encapsulation in Java is a mechanism of wrapping the data (variables) and code acting on the data (methods) together as a single unit. In encapsulation, the variables of a class will be hidden from other classes, and can be accessed only through the methods of their current class. Therefore, it is also known as data hiding.

To achieve data hiding in Java –

1. Declare the variables of a class as private.
 2. Provide public setter and getter methods to modify and view the variables values.
- Explain abstract class and abstract methods.
An abstract class is a class that contains an abstract keyword, it cannot be initiated, but you can subclass it. An abstract method is a method without implementation. If a class contains at least one abstract method it should be marked as abstract. The abstract class in Java cannot be instantiated (we cannot create objects of abstract classes). We use the abstract keyword to declare an abstract class.

Algorithm :	<p>Step 1: Start</p> <p>Step 2: Create abstract class shape.</p> <p>Step 3: Define attributes and method print_area()</p> <p>Step 4: Make subclass rectangle, triangle and circle of abstract class shape.</p> <p>Step 5: Define their attributes and override the method for each shape with formulas of its area.</p> <p>Step 6: Create main class</p> <p>Step 7: Make 3 objects in main class</p> <p>Step 8: Stop</p>
Program:	<pre><code>abstract class shape { int a=3,b=4; abstract public void print_area(); } class rectangle extends shape { public int area_rect; public void print_area() { area_rect=a*b; System.out.println("The area of rectangle is:"+area_rect); } } class triangle extends shape { int area_tri; public void print_area() { area_tri=(int) (0.5*a*b); System.out.println("The area of triangle is:"+area_tri); } } class circle extends shape { int area_circle; public void print_area() {</code></pre>
